

## Introduction and Precautions

The following procedures cover adjustments that are not normally required once the transceiver has left the factory. However, if damage occurs and some parts subsequently be replaced, realignment may be required. If a sudden problem occurs during normal operation, it is likely due to component failure; re-alignment should not be done until after the faulty component has been replaced.

We recommend that servicing be performed by authorized Vertex Standard service technicians, experienced with the circuitry and fully equipped for repair and alignment. If a fault is suspected, contact the selling dealer for instructions regarding repair. Authorized Vertex Standard service technicians have the latest configuration information, and realign all circuits and make complete performance checks to ensure compliance with factory specifications after repairs.

Those who do undertake any of the following alignments are cautioned to proceed at their own risk. Problems caused by unauthorized attempts at realignment are not covered by the warranty policy. Also, Vertex Standard must reserve the right to change circuits and alignment procedures in the interest of improved performance, without notifying owners.

Under no circumstances should any alignment be attempted unless the normal function and operation of the transceiver are clearly understood, the cause of the malfunction has been clearly pinpointed and any faulty components replaced, and the need for realignment determined to be absolutely necessary.

The following test equipment (and thorough familiarity with its correct use) is necessary for complete realignment. Most steps do not require all of the equipment listed, but the interactions of some adjustments may require that more complex adjustments be performed in a sequence. Do not attempt to perform only a single step unless it is clearly isolated electrically from all other steps. Rather, have all test equipment ready before beginning, and follow all of the steps in a section in the order they are presented.

## Required Test Equipment

- ☐ RF Signal Generator
- ☐ AF Signal Generator
- ☐ Spectrum Analyzer good to at least 1 GHz.
- ☐ Frequency Counter

## Alignment Preparation & Precautions

A 50-ohm RF Dummy load and in-line wattmeter must be connected to the "ANT 1" jack in all procedures that call for transmission, except where specified otherwise. Correct alignment is not possible with an antenna.

After completing one step, read the following step to determine whether the same test equipment will be required. If not, remove the test equipment (except dummy load and wattmeter, if connected) before proceeding.

Correct alignment requires that the ambient temperature be the same as that of the transceiver and test equipment, and that this temperature be held constant between 68 °F ~ 86 °F (20 °C ~ 30 °C). When the transceiver is brought into the shop from hot or cold air, it should be allowed time to come to room temperature before alignment.

Whenever possible, alignments should be made with oscillator shields and circuit boards firmly affixed in place. Also, the test equipment must be thoroughly warmed up before beginning.

**Note:** Signal levels in dB referred to in this procedure are based on 0 dBμ = 0.5 μV (closed circuit).

- ❑ Press and hold in the [1(1.8)], [2(3.5)], and [3(7)] keys, while turning the radio on, to enter the alignment mode.
- ❑ Rotate the Main Tuning Dial knob to select the alignment parameter “d40 rAC.”
- ❑ Rotate the [SUB(VFO-B)] knob so that the VFO-B frequency display shows “0.”
- ❑ Press the PTT switch, then rotate the [SUB(VFO-B)] knob so that the VFO-B frequency display shows “060.”
- ❑ Release the PTT switch.
- ❑ Perform the same procedures for the Alignment Menus “d40 rAC” through “d49 rAC.”
- ❑ Press and hold in the [MENU] button for 2 seconds to save the new setting and exit from the alignment mode.

## FM MAX Deviation Adjustment

- ❑ Connect the Dummy Load, Wattmeter, and Deviation Meter to the “ANT 1” Jack.
- ❑ Set the Main Band (VFO-A) frequency to 28.700 MHz in the FM mode.
- ❑ Connect the Audio Generator to pin 8 of the MIC jack (pin 7: GND), then set the output level to 10 mV @1 kHz.
- ❑ Press and hold in the [1(1.8)], [2(3.5)], and [3(7)] keys, while turning the radio on, to enter the alignment mode.
- ❑ Rotate the Main Tuning Dial knob to select the alignment parameter “d51 F45.”

- ❑ Release the PTT switch.

- ❑ Set the Main Band (VFO-A) operating mode to the FM-N mode.
- ❑ Rotate the Main Tuning Dial knob to select the alignment parameter “d52 F23.”
- ❑ Press the PTT switch, then rotate the [SUB(VFO-B)] knob for 2.25 kHz ( $\pm 0.15$  kHz) on the Deviation Meter.
- ❑ Release the PTT switch.
- ❑ Press and hold in the [MENU] button for 2 seconds to save the new setting and exit from the alignment mode.

## COMP Meter Adjustment

- ❑ Press and hold in the [ANT1], [ANT3], and [RX ANT] keys, while turning the radio on, to enter the alignment mode.
- ❑ Rotate the Main Tuning Dial knob to select the alignment parameter “d57 C10,” then rotate the [SUB(VFO-B)] knob for “10 dB” on the COMP meter.
- ❑ Rotate the Main Tuning Dial knob to select the alignment parameter “d58 C20,” then rotate the [SUB(VFO-B)] knob for “20 dB” on the COMP meter.
- ❑ Rotate the Main Tuning Dial knob to select the alignment parameter “d59 C30,” then rotate the [SUB(VFO-B)] knob so that the COMP meter deflects to full scale.
- ❑ Press and hold in the [MNU] key for 2 seconds to exit from the alignment mode.

## SWR Meter Adjustment

- ❑ Switch the external display to “SWR Monitor” page.
- ❑ Connect the 50-Ohm Dummy Load and Wattmeter to the “ANT 1” Jack, then set the [METER] switch to the “SWR” position.
- ❑ Disconnect the 3-pin plug from J1015 on the MAIN Unit, then apply a 4.2 V DC voltage to pin 2 of J1015, and 2.1 V DC to pin 3 of J1015.
- ❑ Press and hold in the [1(1.8)], [2(3.5)], and [3(7)] keys, while turning the radio on, to enter the alignment mode.
- ❑ Rotate the Main Tuning Dial knob to select the alignment parameter “d53c530.”
- ❑ Press the PTT switch, then rotate the [VRF] knob so that the SWR meter (on the external display) reading is “3.0.” The SWR meter reading (3.0) is broad (few points). Therefore, set the [VRF] knob to the center of this broad range.

- ❑ Rotate the [SUB(VFO-B)] knob so that the SWR meter (on the front panel) reading is "3.0."
- ❑ Release the PTT switch.
